NINJATRADER 8 · NINJASCRIPT INDICATOR

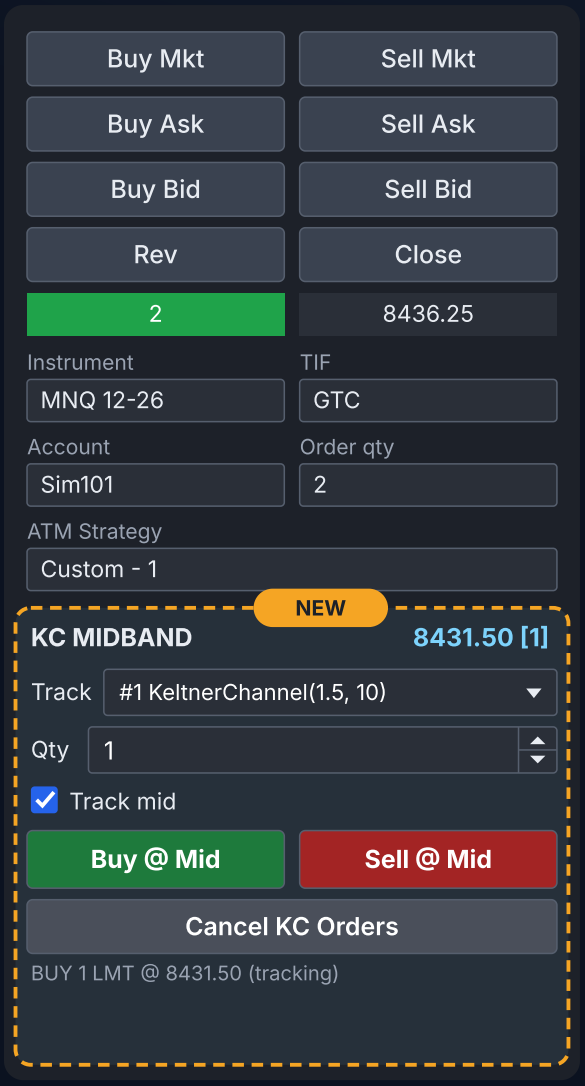

KC Mid Trader

One-click Buy / Sell orders attached to the Keltner Channel midband, built right into Chart Trader.

Conceptualized and developed with AI by **Rangel Alvarado**

1. **Buy @ Mid / Sell @ Mid.** Places the order at the current midband, rounded to the tick.
2. **Own quantity.** Separate contract spinner, 1 by default.
3. **Attached orders.** With *Track mid* on, working orders follow the midband as it moves.
4. **Cancel KC Orders.** Cancels only what this tool placed — your other orders are untouched.
5. **Pick the channel.** Appears only while a Keltner Channel is on the chart; with several, choose which one to track (the first listed by default).
6. **Uses your Chart Trader setup.** Selected account, and optionally the selected ATM strategy.

Safety first: this tool sends and modifies real orders. Validate it on the **Sim101** account before using a live account. Adding controls to Chart Trader is not an officially supported NinjaTrader feature.

STEP A Install the indicator

You only do this once. Requires NinjaTrader 8 (desktop) and the file `KcMidTrader.cs`.

1. **Copy the file**
   Close nothing. Copy `KcMidTrader.cs` into the Indicators folder (path below).
2. **Open the editor**
   Control Center → **New** → **NinjaScript Editor**.
3. **Compile**
   In the editor press **F5** (or right-click → Compile).
4. **Confirm**
   The bottom panel shows no errors. NinjaTrader adds its generated code automatically.

Destination folder

```
Documents\NinjaTrader 8\bin\Custom\Indicators\KcMidTrader.cs
```

Alternative: in the NinjaScript Editor, right-click *Indicators* → **New Indicator**, name it `KcMidTrader`, finish the wizard, select all the generated text, paste the full contents of `KcMidTrader.cs`, and press F5.

If compilation fails

Message	What to do
Error points to *another* file	NinjaTrader compiles every script together. Fix or remove the broken script it names, then press F5 again.
Type or member not found (e.g. `AtmStrategySelector`)	Your NinjaTrader build may name an internal control differently. Update NinjaTrader 8 to the current release; if it persists, send the exact error line.
"KcMidTrader already defines…"	An older copy exists. Keep only one `KcMidTrader.cs` in the folder.

Note: after installing or updating, always do a first run on the Sim101 account before trading a live account.

STEP B Add it to a chart

Do this on every chart where you want the KC buttons.

1

Open a chart

Any instrument and interval you trade.

2

Add Keltner Channel

Ctrl+I → **KeltnerChannel** → Add. Set Period / Offset as usual.

3

Add KcMidTrader

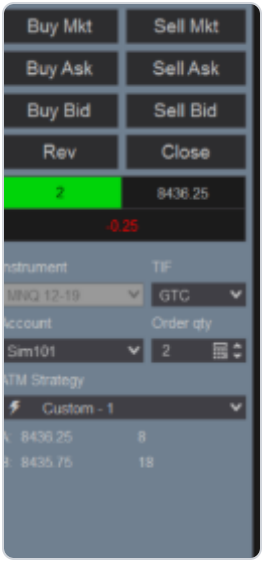

Same dialog → **KcMidTrader** → Add → review its settings → OK.

4

Show Chart Trader

Chart toolbar **Chart Trader** button, or chart Properties → Chart Trader → Visible.

What you should see

Native Chart Trader (before)

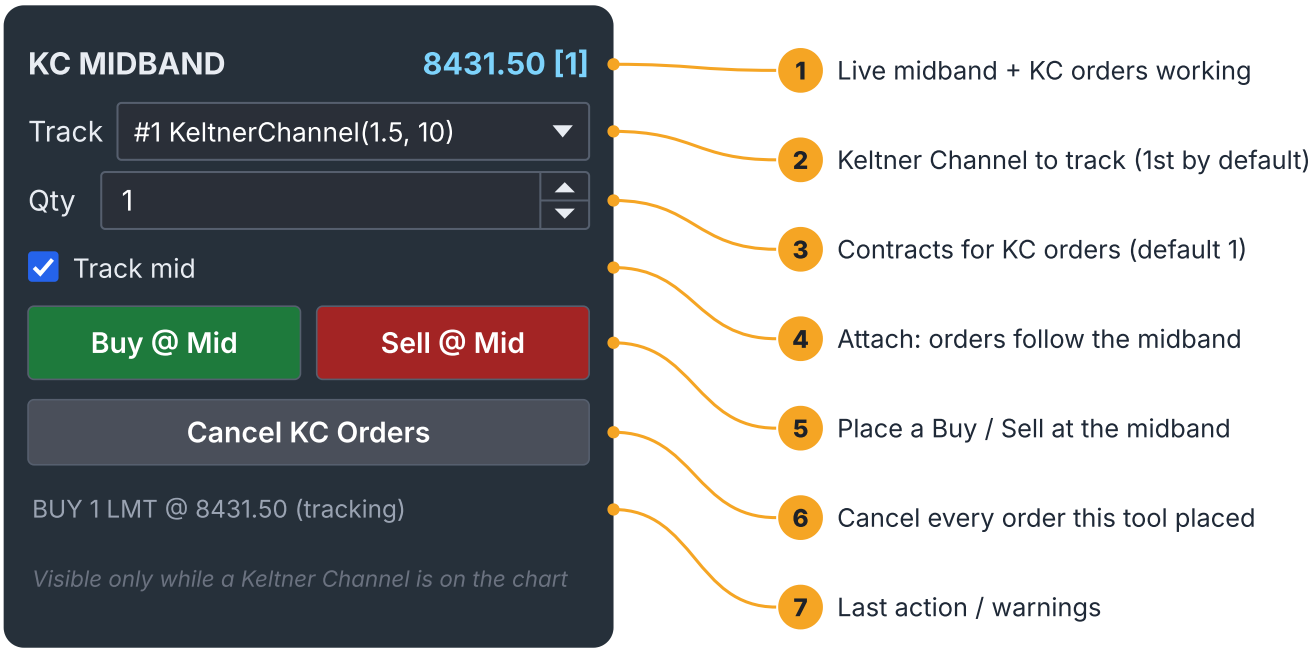

A new **KC MIDBAND** section appears at the bottom of Chart Trader, under the ATM Strategy selector (see the mockup on the cover).

- The midband value updates live once real-time data arrives.
- The **Track** list shows every visible Keltner Channel on the chart (e.g. *#1 KeltnerChannel(1.5, 10)*); the first one is selected by default. Any indicator whose name contains “Keltner” is listed, and the midband is read directly from its middle line.
- Remove or hide the Keltner Channel and the section disappears.
- With several chart tabs, the section follows the active tab.

Tip: save the chart as a template (right-click → Templates → Save) with both indicators, so new charts come ready.

STEP C Using the panel

Seven controls, all in one block.

Typical workflow

#	Action	Result
1	Select account (and ATM, if wanted) in Chart Trader	The KC orders use them. Chart Trader's own *Order qty* is **not** used — the KC spinner is.
2	Pick the channel in **Track**	Only needed with more than one Keltner Channel on the chart. Switching re-anchors working KC orders to the new midband.
3	Set the KC **Qty** with the ▲▼ arrows, mouse wheel or by typing	Defaults to the value in the indicator settings (1).
4	Leave **Track mid** checked	New and existing KC orders follow the midband. Uncheck to freeze them at their current price.
5	Click **Buy @ Mid** or **Sell @ Mid**	Order goes in at the midband. The status line confirms, e.g. *BUY 1 LMT @ 8431.50 (tracking)*. The order also shows on the chart like any other.
6	Click **Cancel KC Orders**	Cancels every working KC order. Your other working orders are not touched.

Cancel vs. Close: Cancel only removes orders that have **not filled**. Once filled you hold a position — manage it with the native **Close** button or your ATM stops/targets.

HOW IT WORKS

Attached orders

With tracking on, the working order is re-priced to the midband until it fills or you cancel it.

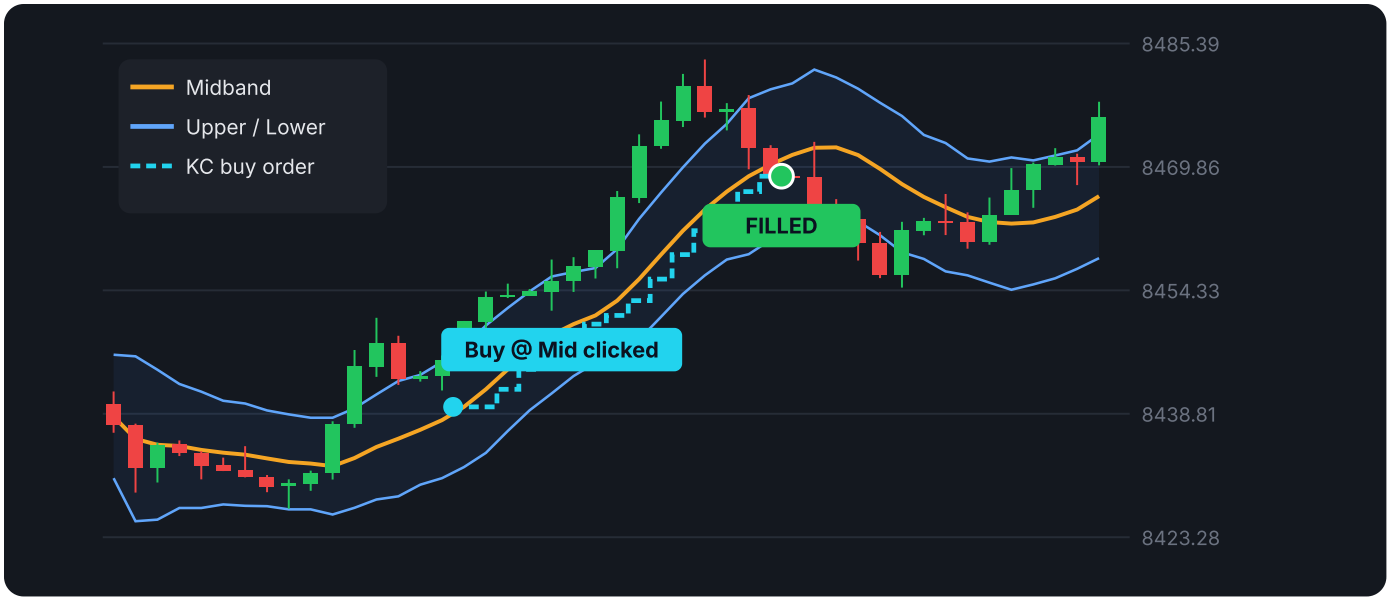

Illustration: a Buy @ Mid order (Buy Limit below price) follows the rising midband and fills when price pulls back into it.

Which order type is used

	MIDBAND ON THE PASSIVE SIDE	MIDBAND ON THE OTHER SIDE OF THE MARKET
BUY	Midband **below** the ask → **Buy Limit** at the midband.	Midband **above** the ask → **Block** (default) or **Buy Stop Market**.
SELL	Midband **above** the bid → **Sell Limit** at the midband.	Midband **below** the bid → **Block** (default) or **Sell Stop Market**.

Track mode

OnPriceChange (default): re-prices whenever the tick-rounded midband moves — tightest tracking.
OnBarClose: re-prices once per bar using the closed bar's midband — fewer modifications.

When the midband crosses the market

Block: tracking pauses and the order stays at its last price; it resumes once the midband is back on the right side.
SwitchToStopMarket: the order is cancelled and, only after the cancel is confirmed, re-submitted as a stop at the midband (never doubled).

REFERENCE Settings & troubleshooting

Settings are in the indicator dialog (Ctrl+I → KcMidTrader), group *KC Mid Trader*.

Setting	Default	Meaning
Indicator name contains	Keltner	Indicators whose name contains this text are listed in **Track**.
Default quantity	1	Starting value of the KC quantity spinner.
Track midband by default	On	Initial state of the *Track mid* checkbox.
Track mode	OnPriceChange	When working orders are re-priced (see page 5).
When midband crosses market	Block	Block, or SwitchToStopMarket.
Time in force	GTC	TIF for KC orders.
Use Chart Trader ATM strategy	On	If an ATM is selected in Chart Trader, KC entries launch it (stops/targets on fill).
Re-adopt working KC orders on reload	On	After a reload/restart, finds non-ATM KC orders (named `KCMid…`) and tracks them again.

Troubleshooting

Symptom	Check
KC section does not appear	Is an indicator with “Keltner” in its name on the chart and **visible**? Chart Trader visible? Active chart tab? Open **New → NinjaScript Output**: the tool prints the indicators it sees on the chart.
“Waiting for real-time data...”	Connection is not live yet or the market is closed. Use the Playback or Sim connection to test.
“Blocked: midband is above/below the market”	A limit there would fill immediately. Wait, or set *When midband crosses market* to SwitchToStopMarket.
Order does not move	*Track mid* unchecked, tracking paused (see status line), or Track mode = OnBarClose (moves only at bar close).
Orders still working after removing the indicator	By design: reloads must not cancel orders. Click **Cancel KC Orders** before removing the indicator.
ATM orders not tracked after a reload	NinjaTrader requires ATM entries to be named “Entry”, so they can’t be identified. Cancel them from the chart or Orders tab.
Several Keltner Channels on the chart	Choose one in the **Track** list (first listed by default). The list refreshes each time you open it; a hidden channel is not listed.
